

Name of scientific school: Generalized solutions of nonlinear integro-differential and difference equations

Scientific advisor: Professor of Algebra and Geometry Department, Dr. Sci. in Physics and Mathematics, Professor Evgeny Panov

Year of foundation of the scientific school: 2005

The staff of the scientific team: total number of members – 10, including doctors of sciences – 4, masters of sciences – 3

The main results of the team's work over the 2013 to 2016 period:

- Existence and uniqueness of almost periodic generalized entropic solutions of the Cauchy problem for quasilinear first-order equations is proved, the property of stabilizing solutions for large times is established;
- New variants of H-measures are developed; with their help the properties of strong precompactness of sequences of nonlinear elliptic-hyperbolic equation quasisolutions are established;

- Problem of conjugation of λ -holomorphic functions on the area boundary is investigated, applications to boundary value problems for elliptic systems in plane domains are given;
- Boundary properties of generalized Cauchy type integrals are studied;
- Generalized solutions of nonlinear equations arising in mathematical models of gas dynamics and hydrodynamics, problems of antenna analysis and synthesis, prediction, optimization and stability problems are investigated;
- Properties of stability of solutions of differential and difference equations of the biological population dynamic are studied;
- Numerical methods for solving integro-differential equations of electromagnetic waves diffraction on impedance surfaces of rotation are developed.

The most significant publications of the team over the 2013 to 2016 period:
